---

- Decimal (not binary)
- 20 accumulators of 10 digits
- Programmed manually by switches
- 18,000 vacuum tubes
- 30 tons
- 15,000 square feet
- 140 kW power consumption
- 5,000 additions per second

---

- Vacuum tube - 1946-1957
- Transistor - 1958-1964
- Small scale integration - 1965 on
  - Up to 100 devices on a chip
- Medium scale integration - to 1971
  - 100-3,000 devices on a chip
- Large scale integration - 1971-1977
  - 3,000 - 100,000 devices on a chip
- Very large scale integration - 1978 -1991
  - 100,000 - 100,000,000 devices on a chip
- Ultra large scale integration – 1991 -
  - Over 100,000,000 devices on a chip

# Moore's Law

---

- Increased density of components on chip
- Gordon Moore – co-founder of Intel
- Number of transistors on a chip will double every year
- Since 1970's development has slowed a little
  - Number of transistors doubles every 18 months
- Cost of a chip has remained almost unchanged
- Higher packing density means shorter electrical paths, giving higher performance
- Smaller size gives increased flexibility
- Reduced power and cooling requirements
- Fewer interconnections increases reliability

# ***IBM 360 series***

---

- 1964
- Replaced (& not compatible with) 7000 series
- First planned “family” of computers
  - Similar or identical instruction sets
  - Similar or identical O/S
  - Increasing speed
  - Increasing number of I/O ports (i.e. more terminals)
  - Increased memory size
  - Increased cost
- Multiplexed switch structure

---

- 1964
- First minicomputer (after miniskirt!)
- Did not need air conditioned room
- Small enough to sit on a lab bench
- \$16,000
  - \$100k+ for IBM 360
- Embedded applications & OEM
- BUS STRUCTURE

# ***Semiconductor Memory***

---

- 1970
- Fairchild
- Size of a single core
  - i.e. 1 bit of magnetic core storage
- Holds 256 bits
- Non-destructive read
- Much faster than core
- Capacity approximately doubles each year

# **Intel**

---

- 1971 - 4004
  - First microprocessor
  - All CPU components on a single chip
  - 4 bit
- Followed in 1972 by 8008
  - 8 bit
  - Both designed for specific applications
- 1974 - 8080
  - Intel's first general purpose microprocessor

# ***Solutions***

---

- Increase number of bits retrieved at one time
  - Make DRAM “wider” rather than “deeper”
- Change DRAM interface
  - Cache
- Reduce frequency of memory access
  - More complex cache and cache on chip
- Increase interconnection bandwidth
  - High speed buses
  - Hierarchy of buses

- Peripherals with intensive I/O demands
- Large data throughput demands
- Processors can handle this
- Problem moving data
- Solutions:
  - Caching
  - Buffering
  - Higher-speed interconnection buses
  - More elaborate bus structures
  - Multiple-processor configurations

# ***Improvements in Chip Organization and Architecture***

---

- Increase hardware speed of processor
  - Fundamentally due to shrinking logic gate size
    - More gates, packed more tightly, increasing clock rate
    - Propagation time for signals reduced
- Increase size and speed of caches
  - Dedicating part of processor chip
    - Cache access times drop significantly
- Change processor organization and architecture
  - Increase effective speed of execution
  - Parallelism

# ***Problems with Clock Speed and Logic Density***

---

- Power
  - Power density increases with density of logic and clock speed
  - Dissipating heat
- RC delay
  - Speed at which electrons flow limited by resistance and capacitance of metal wires connecting them
  - Delay increases as RC product increases
  - Wire interconnects thinner, increasing resistance
  - Wires closer together, increasing capacitance
- Memory latency
  - Memory speeds lag processor speeds
- Solution:
  - More emphasis on organizational and architectural approaches

# ***Increased Cache Capacity***

---

- Typically two or three levels of cache between processor and main memory
- Chip density increased
  - More cache memory on chip
    - Faster cache access
- Pentium chip devoted about 10% of chip area to cache
- Pentium 4 devotes about 50%

## ***More Complex Execution Logic***

---

- Enable parallel execution of instructions
- Pipeline works like assembly line
  - Different stages of execution of different instructions at same time along pipeline
- Superscalar allows multiple pipelines within single processor
  - Instructions that do not depend on one another can be executed in parallel

# ***Diminishing Returns***

---

- Internal organization of processors complex
  - Can get a great deal of parallelism
  - Further significant increases likely to be relatively modest
- Benefits from cache are reaching limit
- Increasing clock rate runs into power dissipation problem
  - Some fundamental physical limits are being reached

# ***New Approach – Multiple Cores***

---

- Multiple processors on single chip
  - Large shared cache
- Within a processor, increase in performance proportional to square root of increase in complexity
- If software can use multiple processors, doubling number of processors almost doubles performance
- So, use two simpler processors on the chip rather than one more complex processor
- With two processors, larger caches are justified
  - Power consumption of memory logic less than processing logic

# ***x86 Evolution (1)***

---

- 8080
  - first general purpose microprocessor
  - 8 bit data path
  - Used in first personal computer – Altair
- 8086 – 5MHz – 29,000 transistors
  - much more powerful
  - 16 bit
  - instruction cache, prefetch few instructions
  - 8088 (8 bit external bus) used in first IBM PC
- 80286
  - 16 Mbyte memory addressable
  - up from 1Mb
- 80386
  - 32 bit
  - Support for multitasking
- 80486
  - sophisticated powerful cache and instruction pipelining
  - built in maths co-processor

# ***x86 Evolution (2)***

---

- Pentium
  - Superscalar
  - Multiple instructions executed in parallel
- Pentium Pro
  - Increased superscalar organization
  - Aggressive register renaming
  - branch prediction
  - data flow analysis
  - speculative execution
- Pentium II
  - MMX technology
  - graphics, video & audio processing
- Pentium III
  - Additional floating point instructions for 3D graphics

# ***x86 Evolution (3)***

---

- Pentium 4
  - Note Arabic rather than Roman numerals
  - Further floating point and multimedia enhancements
- Core
  - First x86 with dual core
- Core 2
  - 64 bit architecture
- Core 2 Quad – 3GHz – 820 million transistors
  - Four processors on chip
- x86 architecture dominant outside embedded systems
- Organization and technology changed dramatically
- Instruction set architecture evolved with backwards compatibility
- ~1 instruction per month added
- 500 instructions available
- See Intel web pages for detailed information on processors

---

- Designed by ARM Inc., Cambridge, England
- Licensed to manufacturers
- High speed, small die, low power consumption
- PDAs, hand held games, phones
  - E.g. iPod, iPhone
- Acorn produced ARM1 & ARM2 in 1985 and ARM3 in 1989
- Acorn, VLSI and Apple Computer founded ARM Ltd.

# **Performance Assessment**

## **Clock Speed**

---

- Key parameters
  - Performance, cost, size, security, reliability, power consumption
- System clock speed
  - In Hz or multiples of
  - Clock rate, clock cycle, clock tick, cycle time
- Signals in CPU take time to settle down to 1 or 0
- Signals may change at different speeds
- Operations need to be synchronised
- Instruction execution in discrete steps
  - Fetch, decode, load and store, arithmetic or logical
  - Usually require multiple clock cycles per instruction
- Pipelining gives simultaneous execution of instructions
- So, clock speed is not the whole story

# Benchmarks

---

- Programs designed to test performance
- Written in high level language
  - Portable
- Represents style of task
  - Systems, numerical, commercial
- Easily measured
- Widely distributed
- E.g. System Performance Evaluation Corporation (SPEC)
  - CPU2006 for computation bound
    - 17 floating point programs in C, C++, Fortran
    - 12 integer programs in C, C++
    - 3 million lines of code
  - Speed and rate metrics
    - Single task and throughput

# ***SPEC Speed Metric***

---

- Single task
- Base runtime defined for each benchmark using reference machine
- Results are reported as ratio of reference time to system run time
  - $T_{ref_i}$  execution time for benchmark  $i$  on reference machine
  - $T_{sut_i}$  execution time of benchmark  $i$  on test system

$$r_i = \frac{T_{ref_i}}{T_{sut_i}}$$

- Overall performance calculated by averaging ratios for all 12 integer benchmarks
  - Use geometric mean
    - Appropriate for normalized numbers such as ratios

$$r_G = \left( \prod_{i=1}^n r_i \right)^{1/n}$$

# ***SPEC Rate Metric***

---

- Measures throughput or rate of a machine carrying out a number of tasks
- Multiple copies of benchmarks run simultaneously
  - Typically, same as number of processors
- Ratio is calculated as follows:
  - $T_{ref_i}$  reference execution time for benchmark  $i$
  - $N$  number of copies run simultaneously
  - $T_{sut_i}$  elapsed time from start of execution of program on all  $N$  processors until completion of all copies of program
  - Again, a geometric mean is calculated

$$r_i = \frac{N \times T_{ref_i}}{T_{sut_i}}$$

# ***Amdahl's Law***

---

- Gene Amdahl [AMDA67]
- Potential speed up of program using multiple processors
- Concluded that:
  - Code needs to be parallelizable
  - Speed up is bound, giving diminishing returns for more processors
- Task dependent
  - Servers gain by maintaining multiple connections on multiple processors
  - Databases can be split into parallel tasks

# Amdahl's Law Formula

- For program running on single processor
  - Fraction  $f$  of code infinitely parallelizable with no scheduling overhead
  - Fraction  $(1-f)$  of code inherently serial
  - $T$  is total execution time for program on single processor
  - $N$  is number of processors that fully exploit parallel portions of code

$$\text{Speedup} = \frac{\text{time to execute program on a single processor}}{\text{time to execute program on } N \text{ parallel processors}} = \frac{T(1-f) + Tf}{T(1-f) + \frac{Tf}{N}} = \frac{1}{(1-f) + \frac{f}{N}}$$

- Conclusions
  - $f$  small, parallel processors has little effect
  - $N \rightarrow \infty$ , speedup bound by  $1/(1-f)$

Diminishing returns for using more processors
